

FEATURES

- **HIGH PERFORMANCE E²CMOS™ TECHNOLOGY**
 - 10 ns Maximum Propagation Delay
 - $F_{max} = 62.5$ MHz
 - 8 ns Maximum from Clock Input to Data Output
 - TTL Compatible 24 mA Outputs
 - UltraMOS[®] III Advanced CMOS Technology
- **50% REDUCTION IN POWER**
 - 75mA Typ I_{cc}
- **E² CELL TECHNOLOGY**
 - Reconfigurable Logic
 - Reprogrammable Cells
 - 100% Tested/Guaranteed 100% Yields
 - High Speed Electrical Erasure (<50ms)
 - 20 Year Data Retention
- **EIGHT OUTPUT LOGIC MACROCELLS**
 - Maximum Flexibility for Complex Logic Designs
 - Programmable Output Polarity
 - GAL16V8A Emulates 20-pin PAL[®] Devices with Full Function/Fuse Map/Parametric Compatibility
 - GAL20V8A Emulates 24-pin PAL[®] Devices with Full Function/Fuse Map/Parametric Compatibility
- **PRELOAD AND POWER-ON RESET OF ALL REGISTERS**
 - 100% Functional Testability
- **ELECTRONIC SIGNATURE FOR IDENTIFICATION**

DESCRIPTION

The GAL16V8A and GAL20V8A, at 10 ns maximum propagation delay time, combine a high performance CMOS process with Electrically Erasable (E²) floating gate technology to provide the highest speed performance available in the PLD market. CMOS circuitry allows the GAL16V8A and GAL20V8A to consume just 75mA typical I_{cc} which represents a 50% savings in power when compared to their bipolar counterparts. The E² technology offers high speed (50ms) erase times, providing the ability to reprogram or reconfigure the devices quickly and efficiently.

The generic architecture provides maximum design flexibility by allowing the Output Logic Macrocell (OLMC) to be configured by the user. The GAL16V8A and GAL20V8A are capable of emulating standard 20 and 24-pin PAL[®] devices. The GAL16V8A is capable of emulating standard 20-pin PAL architectures with full function/fuse map/parametric compatibility. The GAL20V8A is capable of emulating standard 24-pin PAL architectures with full function/fuse map/parametric compatibility. On the right is a table listing the PAL architectures that the GAL16V8A and GAL20V8A can replace.

Unique test circuitry and reprogrammable cells allow complete AC, DC, and functional testing during manufacture. Therefore, Lattice guarantees 100% field programmability and functionality of all GAL products. Lattice also guarantees 100 erase/rewrite cycles and that data retention exceeds 20 years.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Supply voltage V_{CC} -5 to +7V
 Input voltage applied -2.5 to $V_{CC} + 1.0V$
 Off-state output voltage applied -2.5 to $V_{CC} + 1.0V$
 Storage Temperature -65 to 125°C

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress only ratings and functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).

SWITCHING TEST CONDITIONS

Input Pulse Levels	GND to 3.0V
Input Rise and Fall Times	3ns 10% – 90%
Input Timing Reference Levels	1.5V
Output Timing Reference Levels	1.5V
Output Load	See Figure

Tri-state levels are measured 0.5V from steady-state active level.

C_L INCLUDES JIG AND PROBE TOTAL CAPACITANCE

COMMERCIAL DEVICES
Refer to AC Test Conditions:
$R_2 = 390\Omega$
1) $R_1 = 200\Omega$ and $C_L = 50pF$
2) Active High $R_1 = \infty$; Active Low $R_1 = 200\Omega$ $C_L = 50pF$
3) Active High $R_1 = \infty$; Active Low $R_1 = 200\Omega$ $C_L = 5pF$

MILITARY DEVICES
Refer to AC Test Conditions:
$R_2 = 750\Omega$
1) $R_1 = 390\Omega$ and $C_L = 50pF$
2) Active High $R_1 = \infty$; Active Low $R_1 = 390\Omega$ $C_L = 50pF$
3) Active High $R_1 = \infty$; Active Low $R_1 = 390\Omega$ $C_L = 5pF$

CAPACITANCE ($T_A = 25^\circ C, f = 1.0 MHz$)

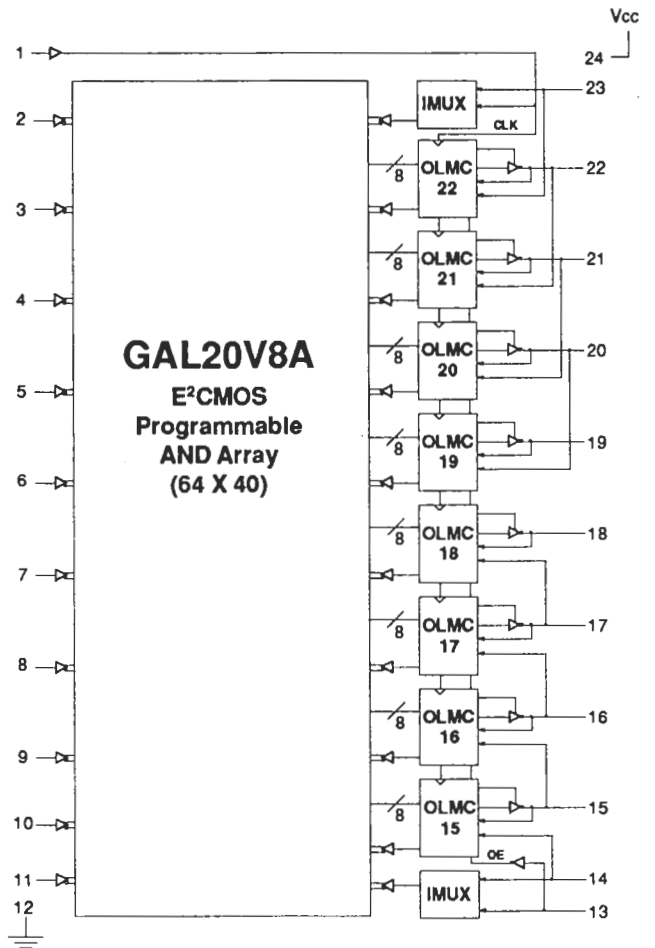

SYMBOL	PARAMETER	MAXIMUM*	UNITS	TEST CONDITIONS
C_i	Input Capacitance	8	pF	$V_{CC} = 5.0V, V_i = 2.0V$
$C_{I/O/Q}$	I/O/Q Capacitance	10	pF	$V_{CC} = 5.0V, V_{I/O/Q} = 2.0V$

*Guaranteed but not 100% tested.

OUTPUT LOGIC MACROCELL (OLMC)

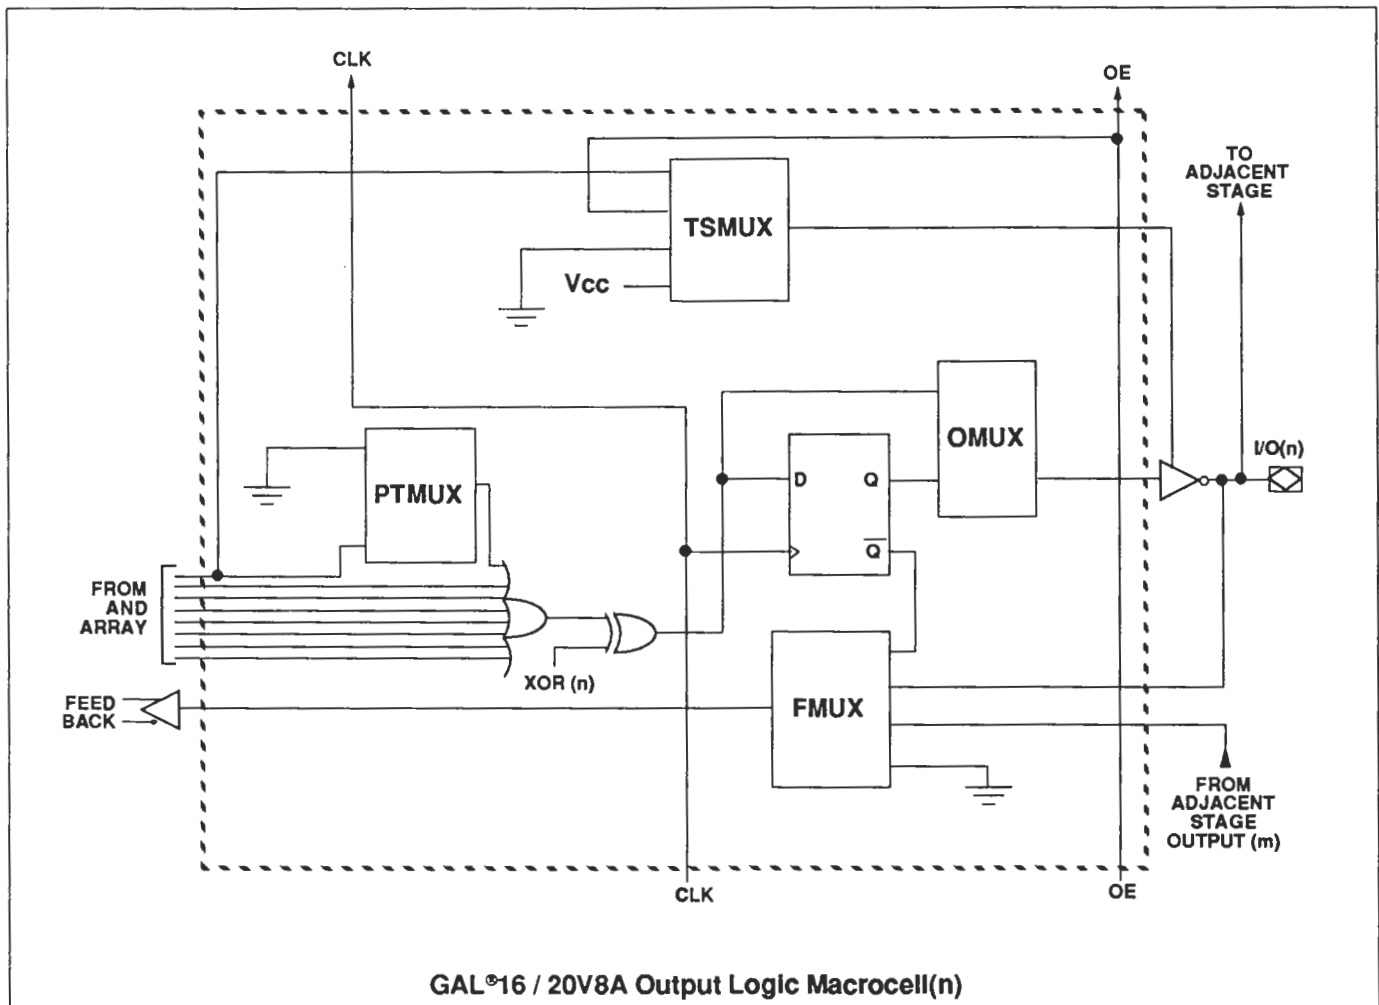

The following discussion pertains to configuring the output logic macrocell. It should be noted that actual implementation is accomplished by development software/hardware and is completely transparent to the user.

There are three OLMC configuration modes possible: registered, complex, and simple. These are illustrated in the diagrams on the following pages. You cannot mix modes, either all OLMCs are simple, complex, or registered (in registered mode the output can be combinational or registered).

The outputs of the AND array are fed into an OLMC, where each output can be individually set to active high or active low, with either combinational (asynchronous) or registered (synchronous)

configurations. A common output enable is connected to all registered outputs; or a product term can be used to provide individual output enable control for combinational outputs in the registered mode or combinational outputs in the complex mode. There is no output enable control in the small mode. The output logic macrocell provides the designer with maximum output flexibility in matching signal requirements, thus providing more functionality than possible with existing 20 and 24-pin PAL® devices.

The six valid macrocell configurations, two configurations per mode, are shown in each of the macrocell equivalent diagrams. Pin and macrocell functions are detailed in the following diagrams.

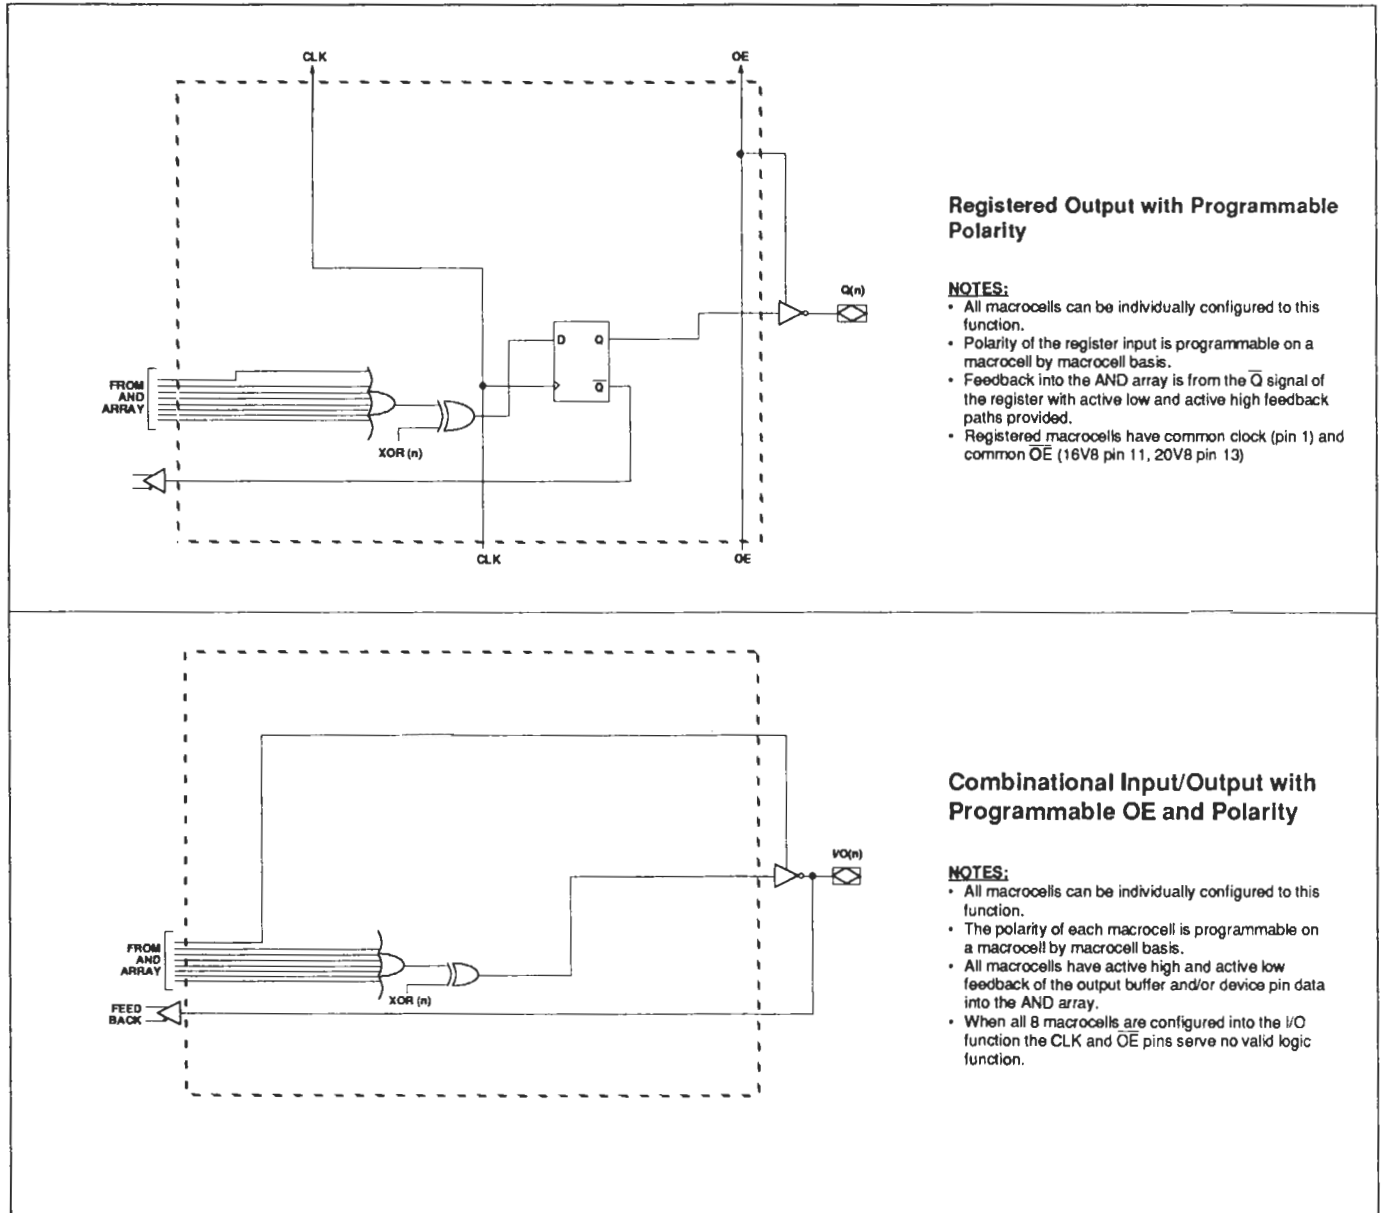

REGISTERED MODE

In the Registered architecture mode macrocells are configured as dedicated, registered outputs or as I/O functions.

Architecture configurations available in this mode are similar to the common 16R8, 20R6 and 16RP4 devices with various permutations of polarity, I/O and register placement.

All registered macrocells share common clock and \overline{OE} control pins. Any macrocell can be configured as registered or I/O. Up to 8 registers or up to 8 I/O's are possible in this mode. Dedicated input or output functions can be implemented as sub-sets of the I/O function.

Registered outputs have 8 data product terms per output. I/O's have 7 data product terms per output.

Note: The development software configures all of the architecture control bits and checks for proper pin usage automatically.

COMPLEX MODE

In the Complex architecture mode macrocells are configured as output only or I/O functions.

Architecture configurations available in this mode are similar to the common 16L8, 20L8 and 16P8 devices with programmable polarity in each macrocell.

Up to 6 I/O's are possible in this mode. Dedicated inputs or out-

puts can be implemented as sub-sets of the I/O function. The two "outboard" macrocells do not have input capability. Designs requiring 8 I/O's can be implemented in the Registered mode.

All macrocells have 7 data product terms per output. One product term is used for programmable OE control. Pins 1 and 11 on a GAL16V8, and pins 1 and 13 on a GAL20V8, are always available as data inputs into the AND array.

Combinational Input/Output with Programmable OE and Polarity

NOTES:

- The outboard macrocells (16V8 pins 12 & 19, 20V8 pins 15 & 22) cannot perform this function.
- The polarity of each macrocell is programmable on a macrocell by macrocell basis.
- Each macrocell has active high and active low feedback of the output buffer and/or device pin data into the AND array.

Combinational Output with Programmable OE and Polarity

NOTES:

- The two outboard macrocells (16V8 pins 12 & 19, 20V8 pins 15 & 22) are permanently configured to this function when in the Complex mode.
- The other 6 macrocells can emulate this mode by not using the feedback data as a data input to the array.
- The polarity of each macrocell is programmable on a macrocell by macrocell basis.

Note: The development software configures all of the architecture control bits and checks for proper pin usage automatically.

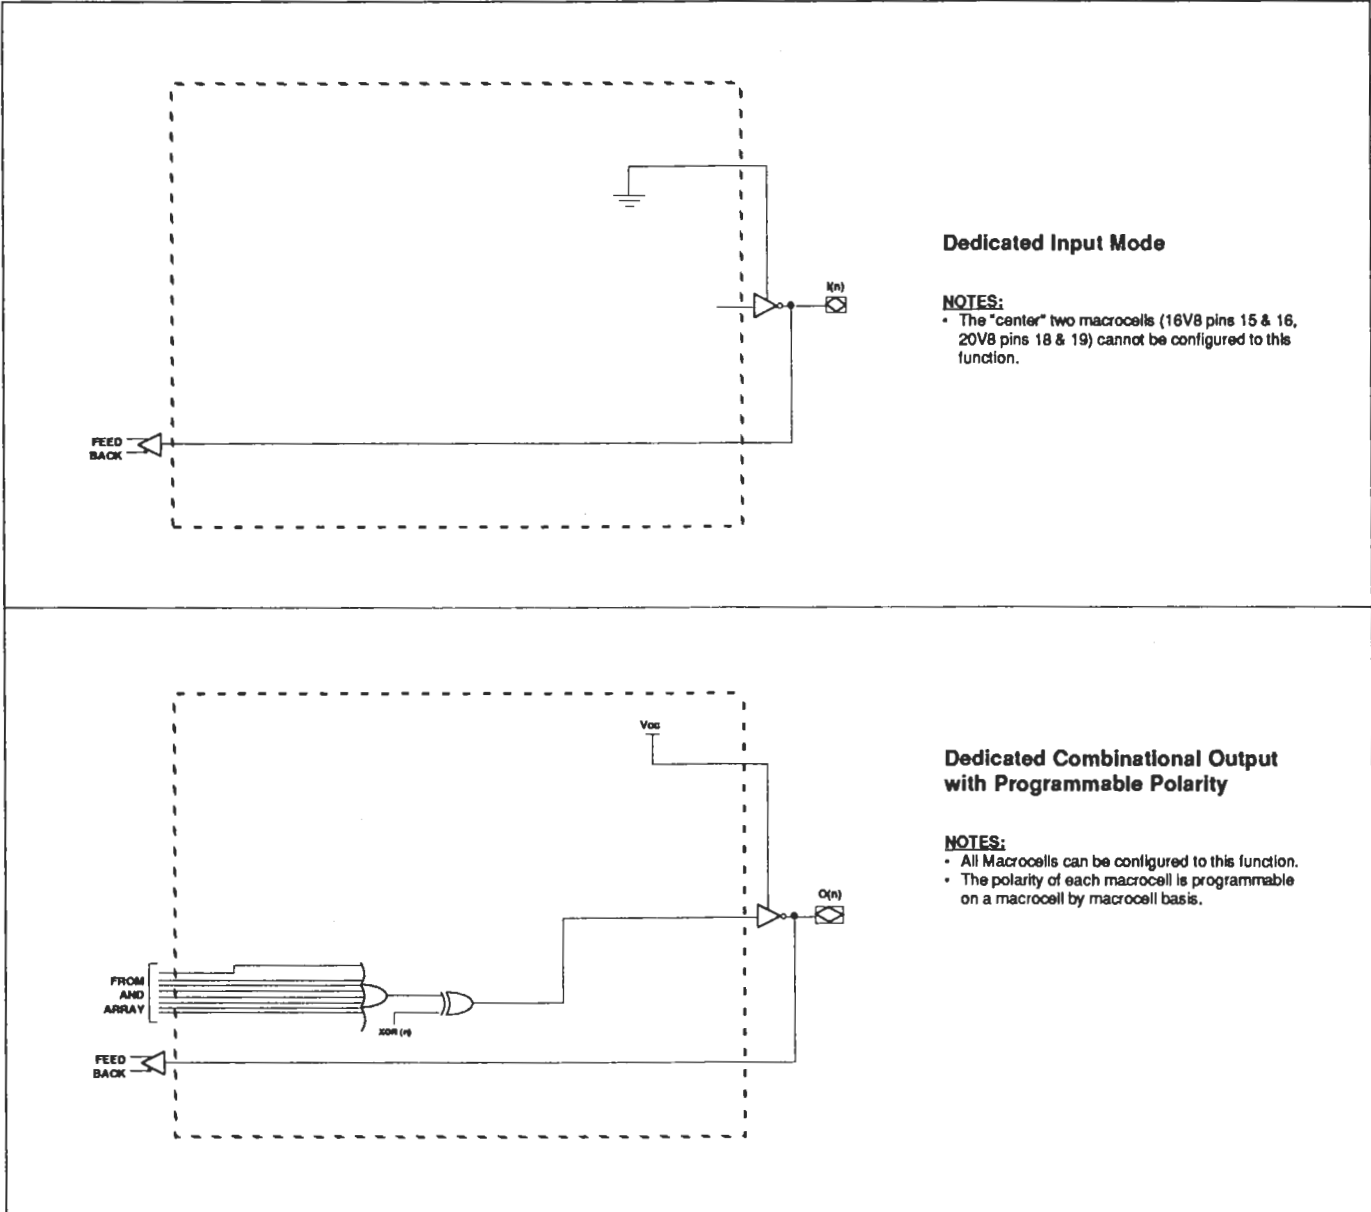

SIMPLE MODE

In the Simple architecture mode pins are configured as dedicated inputs or as dedicated, always active, combinational outputs.

Architecture configurations available in this mode are similar to the common 10L8, 18H4 and 16P6 devices with many permutations of generic polarity output or input choices.

All outputs are associated with 8 data product terms. In addition, each output has programmable polarity.

Pins 1 and 11 on a GAL16V8, and pins 1 and 13 on a GAL20V8, are always available as data inputs into the AND array. The "center" two macrocells (GAL16V8 pins 15 & 16, GAL20V8 pins 18 & 19) cannot be used in the input configuration.

Dedicated Input Mode

- NOTES:**
- The "center" two macrocells (16V8 pins 15 & 16, 20V8 pins 18 & 19) cannot be configured to this function.

Dedicated Combinational Output with Programmable Polarity

- NOTES:**
- All Macrocells can be configured to this function.
 - The polarity of each macrocell is programmable on a macrocell by macrocell basis.

Note: The development software configures all of the architecture control bits and checks for proper pin usage automatically.

ELECTRONIC SIGNATURE

An electronic signature (ES) is provided with every GAL16V8A and GAL20V8A device. It contains 64 bits of reprogrammable memory that can contain user defined data. Some uses include user ID codes, revision numbers, or inventory control. The signature data is always available to the user independent of the state of the security cell.

NOTE: The ES is included in checksum calculations. Changing the ES will alter the checksum.

SECURITY CELL

A security cell is provided with every GAL16V8A and GAL20V8A device as a deterrent to unauthorized copying of the array patterns. Once programmed, this cell prevents further read access to the AND array. This cell can be erased only during a bulk erase cycle, so the original configuration can never be examined once this cell is programmed. The Electronic Signature is always available to the user, regardless of the state of this control cell.

INPUT BUFFERS

GAL16V8A and GAL20V8A devices are designed with TTL level compatible input buffers. These buffers, with their characteristically high impedance, load driving logic much less than traditional bipolar devices. This allows for a greater fan out from the driving logic.

GAL16V8A and GAL20V8A devices do not possess active pull-ups within their input structures. As a result, Lattice recommends that all unused inputs and tri-stated I/O pins be connected to another active input, V_{CC} , or GND. Doing this will tend to improve noise immunity and reduce I_{CC} for the device.

POWER-UP RESET

Circuitry within the GAL16V8A and GAL20V8A provides a reset signal to all registers during power-up. All internal registers will have their Q outputs set low after a specified time (t_{RESET} , 45 μ s MAX). As a result, the state on the registered output pins (if they are enabled through \overline{OE}) will always be high on power-up, regardless of the programmed polarity of the output pins. This feature can greatly simplify state machine design by providing a known state on power-up.

OUTPUT REGISTER PRELOAD

When testing state machine designs, all possible states and state transitions must be verified in the design, not just those required in the normal machine operations. This is because in system operation, certain events occur that may throw the logic into an illegal state (power-up, line voltage glitches, brown-outs, etc.). To test a design for proper treatment of these conditions, a way must be provided to break the feedback paths, and force any desired (i.e., illegal) state into the registers. Then the machine can be sequenced and the outputs tested for correct next state conditions.

GAL16V8A and GAL20V8A devices include circuitry that allows each registered output to be synchronously set either high or low. Thus, any present state condition can be forced for test sequencing. If necessary, approved GAL programmers capable of executing test vectors perform output register preload automatically.

LATCH-UP PROTECTION

GAL16V8A and GAL20V8A devices are designed with an on-board charge pump to negatively bias the substrate. The negative bias is of sufficient magnitude to prevent input undershoots from causing the circuitry to latch. Additionally, outputs are designed with n-channel pull-up instead of the traditional p-channel pullups to eliminate any possibility of SCR induced latching.

BULK ERASE MODE

Before writing a new pattern into a previously programmed part, the old pattern must first be erased. This erasure is done automatically by the programming hardware as part of the programming cycle and takes only 50 milliseconds.

The timing diagram for power-up is shown above. Because of asynchronous nature of system power-up, some conditions must be met to guarantee a valid power-up reset of the GAL16V8A and GAL20V8A. First, the V_{CC} rise must be monotonic. Second, the clock input must become a proper TTL level within the specified time (t_{PR} , 100ns MAX). The registers will reset within a maximum of t_{RESET} time. As in normal system operation, avoid clocking the device until all input and feedback path setup times have been met.
